

Multi-turn Context Sensitive Exchanges: They change the game

Presented:

MobileVoice 2012, San Francisco CA, March 14, 2012

Emmett Coin
Industrial Poet, CEO

Mobile Voice 2012

Who Am I?

- Emmett Coin
 - Speech Scientist
 - Advanced conversational (dialog) systems
 - Technology Expertise:
 - Embedded/wearable/harsh-environment
 - Multimodal Dialog engine architecture and design
 - Industrial Poet
 - Rugged solutions
 - Compact and elegant methodology
 - The power of the spoken word
 - The naturalness of human-computer interaction

What Is “” Talk

- ejTalk is pronounced “edge talk”
- We address the task of managing intelligent multi-turn conversations with the machine.
- I have been involved in this endeavor for about two decades.
- Those who have seen my past presentations at Mobile Voice and other conferences already know about "Cassandra".
- You may see a lot more of her.

Is “This” Time the Time?

- Seems like now is the time that the public is ready to accept conversational interaction with intelligent systems.
- Infrastructure is finally in place to capture, process and synthesize natural human speech quite well.
- It takes generational time scales for humans to embrace fundamental new behaviors
- This latest generation thinks it is natural and obvious that one should gesture and speak with their devices.
- And (not the least of the reasons) some of us have begun to think about "true conversation".
- BUT ... just yesterday a person in New York sued Apple for “intentional” and “negligent” misrepresentation.

Context is Key

- Some recent commercial systems have been “nodding” in the direction of conversation.
- Most of us have tried Google voice search and who hasn’t heard about Siri.
- Both of these are good small steps toward a conversational interaction because they allow you to say something reasonably naturally.
- They try to figure out what you meant and generate a response.
- For the most part these systems are just query/answer paradigms and with some minor exceptions make no serious attempt to keep context.
- BUT context is a BIG PART of any real conversation.

What I will talk about

- A very brief overview of how this technology is being integrated into commercial projects today.
- A short description of a Stone Soup like approach to advanced dialog with the AVIOS Advanced Dialog Group.
- A look at challenging demonstration of this technology “in the wild”. Or, how we might “raise” the synthetic agent we really want.

What commercial products plan to use “real” conversation?

- There are a range of conventional applications (read: funded money making ventures) that will become much better with true conversational technology.
- These ventures are currently being stealthy so we can't talk about them right now. When money is involved everyone gets all secretive, sorry.
- But some examples ...

Some “real” things that converse?

- New Interactions is a funded stealth mode startup with very big goals to “naturalize” a very common human activity.
- Synthetic educators: One specific case is a “doctor” that can explain the issues of diabetes to lay people.
- Virtual greeters: One example is a bank that wants to let potential customers explore services offered.

Stone Soup

(and the AVIOS Advanced Dialog Group)

- The Advanced Dialog group has long had as a goal to foster and promote ways to build more natural and sophisticated dialogs.
- Certainly one part of the “conversation” problem is ASR and TTS. And the AT&T Mashup provides a nice solution to that.
- ejTalk is in the process of making the ejTalker conversation engine available to the Advanced Dialog Group.

AVIOS Advanced Dialog group

- Working directly with AVIOS group to make this technology available for experimentation.
- The ejTalker conversation engine is an implementation of an interpreter of an XML-based conversation definition language.
- One of the goals of the advanced dialog group is to explore requirements and formalisms for a next generation multi-modal interaction engine.
- ejTalk will work toward implementing any promising new functional specifications that the group comes up with (in a continuous virtuous cycle).
- The hope is that the needs and explorations of this group will suggest solutions that others could provide solutions to.

Cassandra the Candidate

ejTalk Presents ...

Cassandra the Candidate!

or type something here ...

Understood:
Said:

Cassandra wants to be a

Candidate

- It's difficult for new technologies to be experienced by large sectors of the public.
- Apps are targeted towards specific domains (e.g. stocks, email, etc.)
- Even if the application is great it is only used by a small group.
- Just for fun, ejTalk thought it might be entertaining and educational for the general population to "play around with" this technology in a non-demanding (slightly kitschy) way.
- Cassandra has begun her debate prep and is preparing to talk to you about why she should be the first ever synthetic agent to be President.
- She is new to politics and you can expect her to be a little "rough around the edges".
- You can expect her to get better as she goes.
- Vote Cassandra!

Advanced Dialog Design is just....Debate Prep?
